TMT **Private Cloud Platform**

The TMT Private Cloud platform provides customers with a high-performing, fully resilient, scalable, and secure set of hosting and IT infrastructure services.

It is located in one of Southern England's leading tier 3 data centres and is monitored and managed by TMT engineering teams 24 hours a day, 365 days a year.

TMT PRIVATE CLOUD PLATFORM

TMT's Private Cloud platform combines the best of the public cloud world within a locally hosted and secure data centre.

It is based on highly resilient and state-of-the-art low latency technology from our partner HP, one of the world's leading manufacturers of computing technology. Computing resources and storage capacity can be easily spun up to reflect the needs of an organisation, but with the added benefit of it being held in a data centre local to Southern England. The TMT solution provides customers with a local and more cost-effective set of solutions and services than those typically available from the leading public cloud providers.

The TMT platform is priced on a fixed price basis unlike many public cloud offerings and provides predictability and "known" costs for businesses, allowing easier planning and budgeting of annual IT costs. By comparison, many public cloud offerings can often cause difficulty when understanding the varying monthly pricing.

TMT's Private Cloud platform is highly secure being located in a leading tier 3 data centre and is protected by many leading cyber technologies and in compliance with ISO27001. It also incorporates a comprehensive backup facility. Customers further benefit by getting the "peace of mind" of knowing exactly where their data is being held and indeed being able to visit the facility should they so desire.

BENEFITS

No onsite hardware - The TMT platform eliminates the need to have on site computing hardware thus reducing capital expenditure and eliminating the need to worry about a refresh or upgrade activities as those are all handled automatically by the TMT operations teams managing and operating the platform.

Predictable and fixed pricing - The TMT Private Cloud platform provides the same benefits as a public cloud solution, such as scalability and flexibility, but also at a fixed monthly price thus allowing for ease of budgeting.

Highly performing, flexible and scalable architecture - The TMT platform makes use of state-of-the-art computing infrastructure providing high performance, and the ability for computing resources, storage, virtual services, and additional applications to be "spun up" quickly and cost-effectively.

Highly redundant and secure - TMT's solution makes use of full redundancy and the latest cyber technologies to ensure data is always protected. Data is backed up to an additional location to provide for disaster recovery scenarios.
